

Configuration Tools

FioranoMQ can be configured in several ways:

- FioranoMQ provides a graphical tool, called Fiorano eStudio, to configure and manage one or more FioranoMQ Servers.
- Configuration information can be accessed and modified using Fiorano eStudio in an offline mode if the server is not available.
- Fiorano eStudio allows a user to manage a FioranoMQ server in 'run' mode through online configuration.
- FioranoMQ provides comprehensive support for JMX. Any standard JMX-compliant tool can be used to administer FioranoMQ server. Fiorano ships a JMX-compliant administrative tool, called Fiorano JMX explorer, along with FioranoMQ.
- Administration is undertaken using the FioranoMQ proprietary administration API.
